A. I. Cherepanov (Ed.): Transkontinentalniye svyazi pereletnykh ptits i ikh rol' v rasprostraneni arbovirusov. (Transcontinental connections of migratory birds and their role in the distribution of arboviruses.) Publ. House Nauka, Novosibirsk 1978, 325 pp. Price 3.40 R.

This volume contains papers presented at a symposium held in Novosibirsk July 28 — August 1, 1976 under the above mentioned title (see Daniel M., Folia parasit. (Praha) 24: 259—260, 1977). The proceedings are divided into 4 parts: Regional and transcontinental migrations of birds (40 papers), Biocenotic correlations of migratory birds (16 papers), Ecology of arboviruses and ways of their transmission in biocenosis (24 papers) and Parasites of birds — reservoirs and carriers of arboviruses (18 papers). The first part covers the ornithological problems and contains mainly contributions concerning migrations of Euro-Asiatic species of birds. The second part is devoted to various aspects of the

role of birds in the ecology of arboviruses and in their circulation in natural foci of different geographical areas. The third part contains similar series of problems together with data on the incidence of some viroses in particular countries and results of experimental studies. The final part deals with various groups of bird ectoparasites, primarily from the faunistical point of view. All who are interested in the questions of interrelations between birds, arboviruses and their vectors, will find in these proceedings many suggestive papers. The study of these problems gives a new stimulus to a cooperation of virologists, ornithologists and parasitologists.
